TAHAP REVISI

The screenshot shows a Microsoft Word document with the following details:

- Title:** TERAPI TERTAWA TERHADAP TEKANAN DARAH PADA LANSIA DENGAN HIPERTENSI
- Abstract:** Lansia merupakan salah satu dari grup peningkatan kematian karena faktor penyakit, yang sebagian besar adalah pada sistem karotik-kardiovaskular, yang menyebabkan kematian untuk sebagian besar lansia. Tujuan penelitian ini adalah untuk mengetahui pengaruh terapi tertawa terhadap tekanan darah pada lansia dengan hipertensi dan melihat perbedaan antara tekanan darah pada pasien dengan dan tanpa terapi tertawa terhadap tekanan darah pada lansia dengan hipertensi. Metode: Desain penelitian menggunakan populasi eksperimen dengan teknik purposive sampling dengan teknik koinciden. Teknik pengambilan sampel sociocultural perspective sampling. Instrumen yang digunakan SOPS tekanan darah dan skala tekanan darah. Analisis data menggunakan teknik deskriptif dan analisis perbandingan tanda-tanda. Hasil: Terdapat nilai rata-rata tekanan darah pasien sekitar 146,56 mmHg dan pasien sekitar 131,90 mmHg. Perbedaan tekanan darah pada pasien dengan dan tanpa terapi tertawa terhadap tekanan darah pada lansia dengan hipertensi sebesar 0,00 ($p < 0,05$). Tempat olahraga tertawa terhadap penurunan tekanan darah pada lansia dengan hipertensi.

- Section:** LAUGHER THERAPY AGAINST BLOOD PRESSURE IN THE ELDERLY WITH HYPERTENSION
- Abstract:** Elderly is the final stage of aging process that can result in physiological decline, one of which is the increase in blood pressure. The increase in blood pressure is due to the decrease in elasticity of the large arteries where the arteries do not expand when the heart pump blood through the body. The purpose of this study was to determine the effect of laughter therapy on blood pressure in the elderly with hypertension at Rumah Dinas Dinas dan Lemas (RDL) Lemong District. Design: A quasi-experimental design with a quasi-experimental group and a control group. The design with a control group represented the intervention group and the laughter group. The grouping technique was purposive sampling. The instruments used in the laughter therapy: SBP and blood pressure measurement scales. Data analysis used descriptive analysis and comparison of mean values of blood pressure pre- and post-terapi tertawa. The mean value of SBP in patients was 146,56 mmHg and the mean value of SBP in non-patients was 131,90 mmHg. The difference between the mean values of SBP in patients with and without laughter therapy was $p = 0,00$ ($p < 0,05$), and diastolic blood pressure showed a $p = 0,00$ ($p < 0,05$). Conclusion: The results of the study show that laughter therapy has a significant effect on reducing blood pressure in the elderly with hypertension.
- Keywords:** Hypertension, Elderly, Laughter Therapy
- Conclusion:** Penurunan tekanan darah intubik dan diastolik diperlukan dengan hipertensi. Jika tekanan

The screenshot shows a Microsoft Word document titled "271a - Word". The document contains several sections of text, tables, and figures. At the top, the ribbon menu is visible with tabs like File, Home, Insert, Design, Layout, References, Mailings, Review, View, Help, WPS PDF, and a search bar. The main content area includes a table comparing different teaching methods (Normal, TEXT PA., No Spac., Heading 1, Heading 2) across various metrics. Below this is another table showing student responses to interventions. A third table, "Tabel 1", displays data from a paired sample t-test. The bottom of the screen shows the Windows taskbar with various icons and the date "22/07/2023".
